APOD - Astronomy Picture Of The Day Registration Code

With the International Year of Astronomy coming to an end, ZDNet is hosting a series of software widgets called Astronomy Picture of the Day, which will display an amazing Hubble image or other image of the day on your desktop. The first widget is a basic slideshow of the daily images. But I am planning on creating other widgets and updating them at irregular intervals to display a few upcoming astronomical images, along with a description of their significance. For example, you could get a quick overview of what the Universe is up to on any day, or you could receive daily previews of the next 4 or 5 Hubble exposures. With a basic click on a thumbnail, you could launch the full-size image or view a viewer built-in to the Widget. You could also see what is currently being displayed on my webpage at: Beyond just presenting the daily image, I have plans for Web-based interactivity, which should allow users to play interactive games with the image or even get a lesson on how to correctly identify specific astronomical objects they see. ZDNet will also publish a schedule of all the upcoming APOD images in the form of a weekly calendar widget. License: Both the Widget Engine and APOD software are free and licensed under the GPL. More info at: Cosmic rays are the most numerous particles in the cosmos. They are charged subatomic particles that are in perpetual motion. This video features the Swift Gamma-Ray Burst Mission which was launched in November 2004. The mission was designed to detect gamma-ray bursts emitted during the first 1/3 second after they happen. These light flashes were the most energetic explosions in the universe, millions of times more energetic than normal supernovae. Gamma-ray bursts are widely considered to be the most energetic explosions in the universe. The Swift satellite is the first to discover a new class of incredibly powerful short gamma-ray bursts. See also: An exhilarating view of the solar surface shows what a satellite sees when it flies through the corona. The Sun's corona is one million kilometres or more above the surface, and it is visible only in the ultraviolet portion of the electromagnetic spectrum. When viewed from the Earth, the corona is sometimes
