An Overview of AutoCAD The AutoCAD software can be used as a stand-alone software application or as an add-on module within other AutoCAD-related software. With the free AutoCAD Design Software Starter Edition, users can take advantage of the Autodesk Design Review process and the free Autodesk Solution Gallery. The free Autodesk Design Review process provides support for making preliminary design decisions, while the free Autodesk Solution Gallery provides access to a library of thousands of third-party plug-ins, utilities, and other related software that can be used with the Autodesk Design Review process to enhance and streamline the design workflow. The Autodesk Design Review process is a five-step review process to ensure that the reviewed design meets your requirements and is ready for production. This process is used to make design decisions, design changes, and review drawings to ensure they are within specifications. A design review or Rev 1 is the first step in the Design Review process. After the Rev 1 is complete, the drawing is ready for a Rev 2 and Rev 3. Rev 2 is used to check for consistency, meaning drawings are checked against the database and other drawings to ensure consistency with the original design intent. Rev 3 is used to check for structural integrity or safety. Finally, Rev 4 is used to evaluate the design for manufacturability. Autodesk Design Review Process In this section, we look at how the Autodesk Design Review process works. Rev 1 Reviewer Workflow The first step in the Autodesk Design Review process is the Rev 1 reviewer workflow. Here, a reviewer uses the options available to her in the Rev 1 Reviewer user interface to review the data

Aristolochic acid nephropathy (AAN) is a serious and often fatal kidney disease resulting from consumption of Aristolochia fangchi. 1,4-diamino-2-butanone (DAB) is a major urinary metabolite of aristolochic acid. In a pilot study of 1 patient with AAN, we found that DAB and aristolochic acid I (AA-I) coeluted from an HPLC column, and we developed a method for simultaneous detection of both analytes. The present study examined the utility of DAB as a biomarker for AAN. Thirty-seven patients with AAN, 50 patients with other forms of renal disease, and 50 apparently healthy subjects were included. We determined urinary levels of DAB and urine creatinine (Ucr). The mean concentration of DAB (microg/L) in the patients with AAN was 1,849 +/- 1,092 (SD), which was significantly (P
