Eicosanoids are bioactive lipid compounds of the arachidonic acid family that are involved in a wide range of physiological and pathological conditions. Among the eicosanoid pathway intermediates, we focus on the leukotriene and lipoxin (also named lipoxins) series, and on the cysteinyl leukotrienes. Each of the three main classes of eicosanoid synthesis can be affected by drugs, and modulating leukotriene and lipoxin production can be beneficial in various diseases. The discovery of new molecules related to these series is a challenging task. For instance, the leukotriene C4 (LTC4) antagonist U74006F, a potent inhibitor of the chemotactic factor-1 receptor, is in phase III clinical trials. It has been observed that the treatment of rats or mice with LTC4, in the absence of its action on CysLT1, enhances the expression of 15-LOX-1, the key enzyme in the production of lipoxins. However, the process of 15-LOX-1 induction is not fully understood, especially when the enhanced 15-LOX-1 expression results in LTC4 synthesis. The synthetic pathway of LTC4 has also been elucidated.As we head towards our first predictions after the break of LMP3, LMP2 and WEC teams have been very active over the past week. Le Mans is

just a couple of weeks away and we are sure that competitors will be in top form to prepare themselves for the start of the season. Here are some interesting articles about LMP3, LMP2 and WEC before we get into the discussion. Please have a read, it could be of help in the coming weeks. LMP3: LMP3 has seen lots of announcements and more are expected to follow. The FIA and ACO have already confirmed that it will be an FIA registered class from 2020, with a maximum size of 30 cars. The Automobile Club de l'Ouest has now revealed its plans for the next few years: 2023, 2025 and 2027 will be the start
