A framework that allows the developer to build a complete, object oriented wizard control. Complete, object oriented, Wizard Framework to help .NET developers that is built on .NET 2.0 framework, is written in C# and uses a component based design that makes it really easy to implement. Contains a Wizard (form) component which is the container of all the pages and components used in the page. Each page and component is derived from a User Control class. All the pages and components are managed by an object, containing all the information about the control and its form state. The page contains methods to do all the basic wizard tasks, like validation, navigation, values, etc. All these actions are done by the user control that is inheriting the NavigationUserControl class. Do not know what's .NET 2.0? You can read the feature comparison between .NET 2.0 and .NET 2.0 Extended. This article demonstrates how to build a simple Wizard based application in .NET 2.0. This article also shows how to add custom pages to the wizard using the Neovolve Wizard User Control. Standard Wizard's Page A standard wizard page is added to the wizard control. This page contains 2 TextBoxes, a series of Buttons, and a RadioButton. The wizard's configuration file shown in the figure below. Standard Wizard Page View Wizard's Page Other standard wizard pages are added to the wizard control. This example contains 2 pages. The first page has a series of Buttons and radio buttons. The second page has a series of ComboBoxes, a label, and a few TextBoxes. View Wizard's Page Adding Customized Pages Custom pages can be added to a wizard. This example demonstrates how to add a new page to the wizard using a Wizard Page template. This template will open a new form window. This new form window will be named Title_Form.cs. The second wizard page that is added to the wizard control will be added by inheriting from the WizardPageUserControl and adding some additional functionality to the base class. Creating New Wizard Pages A wizard page can be created by inheriting from the WizardPageUserControl. The WizardPageUserControl class inherits the IWizardPage and the NavigationControl classes. You must add the following new public properties to the WizardPageUser b7e8fdf5c8

What's New in the Neovolve Wizard Framework?

Neovolve Wizard is a framework that abstracts the wizard from the user. All the wizards can be used with the same form. The wizards pages provide custom user interface for the users to interact with. User steps can be added and removed as required. The framework also provides different behavior options that can be set when the wizard is shown. Neovolve Wizard Framework Features: The wizards are interoperable and can be manipulated together as a group. The wizards pages can be developed and tested independently and then used as part of a master wizard. The framework provides a base wizard page class that can be derived. The wizards can be added and removed at will. The wizards pages in the derived wizard page class are all declared as public and can be modified through this derived class. The user steps can be defined and assigned to the wizards when needed. The user steps are not required when the wizard pages are defined in the code and used in the derived wizard class. The user steps can be programmatically activated at run-time. The wizard pages can be activated at run-time. The wizard framework provides a wizard page activation class that allows for run-time activation of wizards. Neovolve Wizard Framework Examples: This article will provide an example of how to integrate the Neovolve Wizard framework into your .Net 2.0 application.
